Science 4 – Fourth Quarter

Performance Task 4.1

Name: Katriane R. Brosas Date: 2-4-26

Grade and Section: 4-Maingat Parent's Signature: _____

Soil and Water Investigation

Observation Table

Title: Which Soil Holds More Water?

Soil Type	Amount of Water Poured (mL)	What Happened to the Water? (Observation)	Did the Water Drain Fast or Slow?	Which Soil Held More Water?
Sand	50 mL	The water quickly went down through the sand.	The water drained very fast.	Sand held less water.
Garden Soil / Loam	50 mL	The water stayed longer in the soil.	The water drained slowly	Garden soil held more water.

Drawing Section (Below the Table)

Draw what happened after you poured water into:

Sand	Garden Soil
 water drains quickly. Sand becomes dry.	 water stays in the soil. soil stays wet.

Guide Questions (For Discussion & Journal)

Before the Investigation

1. Which soil do you think will hold more water? Why? Garden soil will hold more water because it is thicker and has small particles that keep water inside
2. Which soil is common in Bahrain? Sand is common in Bahrain.

During the Investigation

3. What did you observe when water was poured into sand? the water quickly went down and the sand became dry after a short time.
4. What did you observe when water was poured into garden soil? the water stayed longer and the soil remained wet and moist.
5. Which soil absorbed the water faster? Sand absorbs water faster.

After the Investigation

6. Which soil held more water? Garden soil held more water.
7. Why is water important for plant growth? Soil gives plants water, nutrients, and support for their roots.
8. In hot weather in Bahrain, which soil needs more watering? Sandy soil needs more watering because it dries quickly.
9. How can we help plants grow better in sandy soil?

   We can mix compost or garden soil with sand and water the plants regularly.
10. How can your family save water when watering plants at home?

    We can water plants early in morning or late in afternoon, use a watering can, and not waste water.

Please be guided the rubric below:

A. Observation and Recording — 10 points

Score	Quantified Description
10	Observations for both soils are complete and accurate (5 pts) + Recording is clear, organized, and detailed (5 pts)
8	Observations mostly accurate with minor missing details (4 pts) + Recording clear but slightly incomplete (4 pts)
6	Observations partially correct (3 pts) + Recording lacks important details (3 pts)
4	Limited or unclear observations (2 pts) + Poor or incomplete recording (2 pts)
2	Very minimal observation (1 pt) + Very weak recording (1 pt)
0	No observation and no recording submitted

B. Observation Table — 5 points

Score	Quantified Description
5	All parts of the table are fully completed, correct, and clear (5 pts)
4	Table mostly complete with one minor missing or unclear entry (4 pts)
3	Table partially complete with two missing or unclear entries (3 pts)
2	Table has many missing or incorrect entries (2 pts)
1	Very little information written in the table (1 pt)
0	No table completed

C. Drawing and Explanation — 5 points

Score	Quantified Description
5	Drawing is clear and neat showing investigation results (2 pts) + Explanation correctly tells which soil held more water and how it helps plants grow (3 pts)
4	Drawing clear (2 pts) + Explanation mostly correct but lacks detail (2 pts)
3	Simple drawing (1 pt) + Partial explanation (2 pts)
2	Unclear drawing (1 pt) + Weak explanation (1 pt)
1	Minimal drawing OR minimal explanation only
0	No drawing and no explanation submitted
